CRACK JetBrains IntelliJ IDEA Ultimate 2018.2 Crack [CracksMind] All the best, Editor: You must be logged in to rate this answer. Q: Is it possible to use PIL to import an image from a file and keep the transparency information? I would like to import an image from a file and add it to a canvas. I used to use opencv for this but have found that the image I obtain from opencv is not transparent. I would like to use pylab to import the image (pil.imread) and add it to a canvas. Is this possible? The image is.png and not.gif (canvas supports gif but not png). A: OpenCV images have a CvPalette stored with them which stores data in ARGB format. PIL would not automatically detect this information and transparent pixels will still display as white. In addition, PIL doesn't store information about alpha channels, so pixels with alpha value of 255 (and if you draw it, you will also see a completely black image) will also be displayed as white. As the documentation says, PIL.Image.transpose() function can take an optional flag, where 0 stands for "no operation", and the rest of the flags are probably of a similar meaning as the OpenCV's CvScalar. The problem is that it doesn't give any information about whether the image has alpha channels or not. Also, you need to note that pixels with alpha value of 0 (black) will still be displayed as white. Since PIL.Image.transpose() says nothing about the alpha channel and treats black pixels as white, there is nothing wrong with using it to transpose an image from BGR to RGB, but remember that you will still see the alpha channel as white. I don't know what method is used in PIL.Image.getpalette() method to take a screenshot of an image and convert the information. I think that it would be the method's job to 54b84cb42d
